IIT PALAKKAD

1.

COMPUTER SCIENCE AND ENGINEERING

Indian Institute of Technology, Palakkad

CS3210: Computer Networks Lab Lab 2 (HTTP, FTP and SSH)

05 Aug, 2019

Time: 3 hrs

 (a) Connect to host h1. Ensure that you are able to ping x virtnet.com for all h ∈ {h2, h3, h4, h5}. Send 5 ping packets to each of these hosts and report the respective average round-trip time. (b) Host A is running a FTP server, whereas Host B is simultaneously running two HTTP servers on port numbers in the range 8000 to 9000. Identify hosts A and B. What are the incoming ports of the HTTP servers on host B? Can be seen using "nmap -p- h2.virtnet.com 10 A = h2 vi., B = h3 vi., and port 8143, 8534. (c) Let us call the HTTP servers running on host B as S1 and S2. On each of these servers there are two text files (within some directory). Download these files. Hint: directory listing is enabled on these servers. Each of these files contains one half of the password needed to log into the FTP server on host A. Write down this password.wget h3.virtnet.com.pont0 (d) One of the HTTP server on host B runs HTTP/1.0 and the other runs HTTP = h2 view + f (2487) (d) One of the HTTP server on host B runs HTTP/1.0 and the other runs HTTP = view + f (2487) (e) Using command Iftp, FTP into host A using username "tc" and the password obtained in step (c). There is a file called "sol.txt" (within a directory) on this machine. Download it and look at its contents. This file contains the password obtained in the previous step. There is file with the extension ".pcapng" in the home directory of user "tc". What is the name of this file? (g) Download this file to your physical host machine (Hint: host h5 can be accessed via SSH on port 14505 on the loopback IP address of the physical host) and open it with wireshark. Sep -P 4505 (e@localhostmy_capture.pcopy -/Deskto) (h) What you now see in wireshark is a sample packet capture. During the capture, a website was pinged, which host was pinged? What was the IP returned after DNS resolution? How many ping response packets were received? What was the minimum response time for these packets? (i) During the capture, a website was also visited	$\mathbf{r1}$, 1	up the virtual network for this lab. This network has 8 VMs namely h1 , h2 , h3 , h4 , h5 , r2 and r3 . The first 5 VMs are hosts and the rest are routers. In this lab, you only have ss to machine h1 , and the goal is find out a message stored in host h4 .	
servers on port numbers in the range 8000 to 9000. Identify hosts A and B. What are the incoming ports of the HTTP servers on host B? Can be seen using 'nmap -p h2.virnetc.com'10 A = h2.vi B = h3.vi and Port 8143, 8534. (c) Let us call the HTTP servers running on host B as S1 and S2. On each of these servers there are two text files (within some directory). Download these files. Hint: directory listing is enabled on these servers. Each of these files contains one half of the password needed to log into the FTP server on host A. Write down this password.wget h3.virtnet.com:point 10 Pass = "use" + "@487" (a) One of the HTTP server on host B runs HTTP/1.0 and the other runs HTTP/1.1. Match the port number of the servers to corresponding HTTP versions. Wget -server-response -spider h3.virtnet.com:Point Spider is used to avoid downloading. (e) Using command lftp, FTP into host A using username "tc" and the password obtained in step (c). There is a file called "sol.txt" (within a directory) on this machine. Download it and look at its contents. This file contains the password for user "tc" on host h5. Write down this password. Simply using lftp [10] (f) SSH into host h5 using username "tc" and the password obtained in the previous step. There is file with the extension ".pcapng" in the home directory of user "tc". What is the name of this file? (g) Download this file to your physical host machine (Hint: host h5 can be accessed via SSH on port 14505 to m the loopback IP address of the physical host) and open it with wireshark. sop. P14505 to@localhost:my_capture_pcopy -/Desktop (h) What you now see in wireshark is a sample packet capture. During the capture, a website was pinged, which host was pinged? What was the IP returned after DNS resolution? How many ping response packets were received? What was the minimum response time for these packets? (i) During the capture, a website was also visited using a browser. What is the hostname of this file?
